## Abstracts

The IoT Building Management System is a comprehensive platform based on IoT technology that provides integrated monitoring and intelligent management of a building's facilities, environment, energy, and security. Its core architecture consists of a perception layer, a network layer, a platform layer, and an application layer. The perception layer collects real-time building operation data through various sensors (such as temperature and humidity, lighting, energy consumption, and video surveillance equipment); the network layer transmits data using wired or wireless communication technologies (such as 5G, LoRa, and Wi-Fi); the platform layer stores, analyzes, and optimizes data through cloud-edge collaborative computing; and the application layer integrates subsystems such as building automation (BA), security, fire protection, and energy management, providing a unified visual operation interface to enable automatic equipment control, energy efficiency optimization, fault warning, and remote operation and maintenance.

The global IoT Building Management System market size was estimated at USD 241.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
