Report Overview:

A microcontroller (MCU for microcontroller unit) is a small computer on a single metal-oxide-semiconductor (MOS) integrated circuit chip. In modern terminology, it is similar to, but less sophisticated than, a system on a chip (SoC); a SoC may include a microcontroller as one of its components. A microcontroller contains one or more CPUs (processor cores) along with memory and programmable input/output peripherals. Program memory in the form of ferroelectric RAM, NOR flash or OTP ROM is also often included on chip, as well as a small amount of RAM. Microcontrollers are designed for embedded applications, in contrast to the microprocessors used in personal computers or other general purpose applications consisting of various discrete chips. At present, microcontroller is employed substantially across many automated Internet of Things products and devices such as power tools, remote controls, office machines, automobile engine controls, and medical devices.

The Global IoT Microcontroller (MCU) Market Size was estimated at USD 3893.48 million in 2023 and is projected to reach USD 7401.31 million by 2029, exhibiting a CAGR of 11.30% during the forecast period.
