Report Overview:

IoT smart capacitive proximity sensors rely on the ability of objects to hold an electrical charge even when the object is non-conductive. Capacitance is a measure of the amount of charge that can be stored under the application of an applied voltage. The sensor operates by noting the change in capacitance that occurs when an object approaches the sensor. Capacitive proximity sensors are similar in function to inductive sensors but have certain unique design specifications and operating parameters. They rely on the principle of capacitance to detect small objects and can handle both conductive (metallic) and non-metallic material, including unprepared mechanical surfaces and items moving along a conveyor. The usual package style is in the form of a small cylinder with electrodes and wiring at the ends. The capacitive proximity sensor output is typically transmitted as a contact closure or a pulse that is activated when an object reaches a specific distance threshold.

The Global IoT Smart Capacitive Proximity Sensors Market Size was estimated at USD 4045.49 million in 2023 and is projected to reach USD 6174.04 million by 2029, exhibiting a CAGR of 7.30% during the forecast period.
