Report Overview

IoT Laser sensors, also called laser triangulation sensors, are an IoT non-contact sensor technology that uses the triangulation of a reflected light beam to establish movement or position of a target across a measurement range. A semiconductor laser generates a light beam that is sent through a transmitting lens towards the target. Light reflected off the target passes through a receiving lens in the sensor and is focused onto a detector element. As the target changes its position relative to the sensor, the angle of the reflected light will change which results in that light focusing on a different part of the detector element. The change in light position can be analyzed and used to establish the position of the target.
