## Abstracts

IPFS is a decentralized and distributed file storage system that aims to enhance the efficiency and resilience of traditional web protocols. It uses a content-addressed system, where each piece of content is identified by a unique hash, making it harder to censor or manipulate. While IPFS and blockchain are both decentralized technologies, they serve different purposes. IPFS focuses on creating a global, decentralized network for storing and sharing files, while blockchain serves primarily as a decentralized ledger. An IPFS pinning service acts as a liaison between the IPFS protocol and a user-friendly interface that lets you pin or upload files as you would any other storage service. You get all the benefits of hosting your content on the protocol while still having the easy process of uploading it. Without a pinning service, you would need to host your own nodes and have a lot of computing power and a large amount of developer resources to manage the whole process. Reliable IPFS pinning services are highly connected to other nodes in the IPFS network, meaning that they have a better chance of quickly finding and retrieving data than you would running your own nodes. Plus, a good IPFS pinning service has nodes that are always online so users can access your content anywhere at any time, regardless of device.

The global IPFS (InterPlanetary File System) Pinning market size was estimated at USD 72.1 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.30% during the forecast period.
