Integrated Pest Management (IPM) is a crop management concept that aims to create a preventive cultural, physical, biological and chemical control program for crop pests, diseases and nutritional challenges. The purpose of this concept is to grow crops sustainably while protecting the health of consumers, workers and the environment. IPM pheromones are synthetically manufactured and completely mimic naturally secreted pheromones. Pheromones are chemical molecules secreted by insects in the environment. By releasing and receiving these signals, members of the same insect species can understand each other's intentions and take corresponding actions, such as triggering mating responses or gathering with other insects. IPM pheromones use this property to interfere with and regulate the behavior of pests by simulating the sexual attraction, alarm, aggregation and other signals of pests, thereby achieving the purpose of pest control. IPM sex pheromones simulate the sexual attraction signals of pests, help researchers monitor the population dynamics and mating behavior of pests, and provide scientific decision-making basis for pest control. IPM sex pheromones are chemical substances produced and released by female insects to attract insects of the same species for mating. These pheromones are species-specific and are very effective communication signals in the insect world. They are typically volatile compounds that are released into the air and can be detected by male insects through receptors, allowing them to find and mate with female insects. IPM sex pheromones play a vital role in regulating insect reproductive behavior, influencing mating patterns, population dynamics and even pest control strategies. They are widely studied and applied in various fields, including agriculture, entomology and pest management. The industry trend of IPM sex pheromones is driven by a growing interest in sustainable and environmentally friendly pest control practices. Pheromone-based technologies offer precise and targeted control measures, reducing the need for chemical insecticides. There is an increasing focus on developing pheromone formulations that are more

effective, long-lasting, and economically viable for widespread use. Continuous research and advancements are being made in synthesizing and formulating specific pheromones to attract and trap insect pests. Additionally, innovations in delivery systems, such as pheromone lures and dispensers, are being developed to improve their efficiency and ease of application. The trend is towards integrated pest management approaches that incorporate pheromones as a key component for sustainable insect pest control in agriculture and other sectors. The global IPM sex pheromone market presents a diversified competitive situation. Major manufacturers include Shin-Etsu, BASF, Suterra, Biobest Group, Provivi and other well-known companies, which have occupied a certain share in the market with their respective technological advantages, product characteristics and market layout.
