Abstracts

iPSC-derived cell drugs are drugs prepared using induced pluripotent stem cell (iPSC) technology. iPSCs are obtained by introducing specific transcription factors into somatic cells to reprogram them into pluripotent stem cells. These pluripotent stem cells have the potential to differentiate into various cell types and can therefore be used to prepare cell drugs for the treatment of specific diseases. iPSC-derived cell drugs have broad application prospects in the treatment of degenerative diseases, tissue repair, and other areas. By directing the differentiation of iPSCs into specific types of cells, such as neurons and cardiomyocytes, personalized cell replacement therapies can be provided to patients, thereby restoring the function of damaged tissues.

The global iPSC Derived Cell Drugs market size was estimated at USD 219.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
