Abstracts

An Ir Carbon Sulfur Analyzer is an analytical instrument that measures the carbon and sulfur content in various materials?most commonly metals, alloys, ores, ceramics, and other inorganic samples?by employing high-temperature combustion in an induction furnace, where the sample is heated in a pure oxygen environment to convert carbon and sulfur into carbon dioxide (CO?) and sulfur dioxide (SO?), respectively; these resulting gases are then detected using non-dispersive infrared (NDIR) sensors, which provide highly accurate and precise quantitative readings essential for quality control, material verification, and compliance with industry standards in sectors such as metallurgy, mining, automotive, aerospace, and environmental testing.

The global Ir Carbon Sulfur Analyzers market size was estimated at USD 24.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
