Report Overview:

The principle of Iris Recognition Access Control System is to find out the iris data that matches the collected iris from the iris database, and realize the function of opening the door lock by identifying the identity information. The specific design plan of the system: first collect the iris image, and then perform the iris image preprocessing, where the iris positioning is the image preprocessing, and the iris positioning is the key to the image preprocessing, because it is a prerequisite for effective iris recognition, which is to determine The position of the inner and outer edges in the image; adopt a specific algorithm for coding recognition. At this stage, the key is to extract the features of the iris image to be recognized, and compare and determine the features of the iris in the database according to a certain matching algorithm. Then operate the execution state of the door lock, and finally achieve the purpose of identification.
