Abstracts

Iron based self-fluxing alloy powder is a special alloy material with excellent self melting and corrosion resistance, mainly used in the manufacture of wear-resistant and corrosion-resistant components. The preparation of iron based self-fluxing alloy powder mainly adopts atomization method, which throws the melted mother alloy out through high-pressure gas or rotating wheel to break it into small powder. During the preparation process, the composition and melting temperature of the parent alloy have a significant impact on the performance of the final product. Iron based self-fluxing alloy powder has excellent self melting and corrosion resistance, and can maintain good mechanical properties at high temperatures. It has a low melting point and can form good metallurgical bonds with other metal materials. This alloy powder also has good wear resistance and fatigue resistance, which can meet the requirements of various complex working conditions. Iron based self-fluxing alloy powder is mainly used in the manufacturing of wear-resistant and corrosion-resistant components, such as turbine engine components in the aerospace industry and wear-resistant pipelines in chemical equipment. It can also be used to manufacture high-performance materials such as high-temperature alloys and stainless steel. During the manufacturing process, the composition and particle size distribution of alloy powder can be adjusted according to specific needs to achieve optimal performance and application.

The global Iron Based Self Fluxing Alloy Powder market size was estimated at USD 243.46 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
