## Abstracts

The iron core vibration motor is a forced vibration motor. The iron core vibration motor is mainly composed of an eccentric weight fixed on the motor shaft, an iron core fixed on the outer contour, and a coil. As the core component of the motor, the iron core is used to increase the magnetic flux of the inductor coil to achieve the maximum conversion of electromagnetic power. When the current passes through the coil, the iron core will be attracted by the electromagnetic force, which will drive the eccentric weight to vibrate.

The global Iron Core Vibration Motor market size was estimated at USD 1376.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
