Abstracts

Iron powder toroids are magnetic components made by compressing and heat-treating iron powder into a toroidal (donut-shaped) form, commonly used in inductors, transformers, and EMI suppression. Their toroidal shape ensures excellent magnetic flux containment, minimizing electromagnetic interference. These toroids offer moderate permeability, good DC bias characteristics, and low core loss at low to medium frequencies (typically up to a few MHz). Compared to ferrite cores, iron powder toroids are more cost-effective and perform well over a broad temperature range, making them ideal for power supplies, RF circuits, and various filtering applications.

The global Iron Powder Toroids market size was estimated at USD 549.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
