Abstracts

Iron sucrose injection is a parenteral iron preparation used to treat iron deficiency anemia in patients who cannot tolerate or have an inadequate response to oral iron, particularly those with chronic kidney disease. It functions by replenishing iron stores and supporting erythropoiesis, with the iron component bound to a sucrose matrix to allow controlled release and minimize adverse reactions. This formulation is administered intravenously under clinical supervision, ensuring bioavailability while reducing gastrointestinal side effects commonly associated with oral supplements. Its use is especially critical in dialysis-dependent and non-dialysis chronic kidney disease patients, where efficient iron repletion is necessary to optimize response to erythropoiesis-stimulating agents and manage anemia-related complications.

The global Iron Sucrose Injection market size was estimated at USD 1250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
