Abstracts

An ironcoreless linear motor is a direct-drive electromechanical actuator that operates on the principles of Lorentz force, where an energized coil assembly (forcer) moves along a magnetic track without the use of iron laminations in the coil. This design eliminates cogging—an undesirable detent force present in ironcore variants—resulting in exceptionally smooth motion, minimal force ripple, and high acceleration capabilities. By forgoing iron in the moving part, these motors achieve lower mass and reduced magnetic attraction forces, enhancing dynamic performance and positioning accuracy. They are particularly suited for applications requiring precise, high-speed, and repeatable linear motion, such as in semiconductor manufacturing, biomedical instrumentation, and high-end automation systems, where minimal particulate generation and vibration are critical.

The global Ironcoreless Linear Motor market size was estimated at USD 528.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.85% during the forecast period.
