Abstracts

Irregular copper powder refers to non-spherical copper particles characterized by uneven shapes, jagged edges, and varied surface textures, typically produced through mechanical methods such as milling, crushing, or electrolytic deposition rather than atomization processes. This morphology results in higher surface area, increased interparticle friction, and enhanced mechanical interlocking capabilities compared to spherical alternatives. Its irregular geometry makes it particularly valuable in applications requiring improved conductivity in composite materials, enhanced sintering behavior in powder metallurgy, efficient filtration media, and specialized conductive pastes or coatings where particle shape influences performance.

The global Irregular Copper Powder market size was estimated at USD 285.62 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.30% during the forecast period.
