Abstracts

Isolated resistor networks, also known as resistor array networks or resistor isolation networks, are integrated passive components consisting of multiple individual resistors manufactured within a single package, where each resistor is electrically isolated from the others, meaning they share no common connection point and operate independently without mutual interference. These networks are characterized by their compact form factor, improved reliability due to matched resistor characteristics such as tolerance and temperature coefficient, and enhanced performance in applications requiring precise, stable, and isolated resistance paths, commonly used in analog signal conditioning, voltage division, pull-up/pull-down configurations, and impedance matching in various electronic circuits.

The global Isolated Resistor Network market size was estimated at USD 325.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
