Abstracts

Isooctyl fluroxypyr acetate is a synthetic auxin herbicide belonging to the pyridine carboxylic acid chemical class, widely used in agriculture for selective control of broadleaf weeds in cereal crops such as wheat, barley, oats, and corn. This ester formulation of fluroxypyr offers enhanced plant absorption and rainfastness compared to its acid or salt counterparts, making it particularly effective in post-emergence applications where rapid uptake and translocation within target weeds are critical. Its mechanism of action involves mimicking natural plant hormones, leading to uncontrolled growth and eventual death of susceptible weeds, while demonstrating favorable crop safety profiles when applied according to label recommendations. The compound is valued for its efficacy against resistant weed biotypes and its compatibility with integrated weed management systems, contributing to sustainable agricultural practices by reducing the reliance on more persistent or soil-active herbicides.

The global Isooctyl Fluroxypyr Acetate market size was estimated at USD 125.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
