Abstracts

Isophane insulin injection, commonly known as NPH insulin, is an intermediate-acting insulin suspension used primarily in the management of diabetes mellitus. It consists of human insulin complexed with protamine and zinc, which slows its absorption from subcutaneous tissue, resulting in an extended duration of action typically lasting between 12 to 18 hours. This formulation is designed to provide basal insulin coverage, helping to maintain stable blood glucose levels between meals and overnight, and is often used in combination with rapid- or short-acting insulins to mimic the body's natural insulin profile. Its cloudy appearance requires careful resuspension before administration to ensure dosing accuracy.

The global Isophane Insulin Injection market size was estimated at USD 2526.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.85% during the forecast period.
