Abstracts

Isoproterenol hydrochloride is a synthetic catecholamine and non-selective beta-adrenergic receptor agonist primarily used in medical settings as a potent bronchodilator for acute asthma attacks, a cardiac stimulant in certain cases of bradycardia or heart block, and as a vasodilator in shock management. It functions by activating both beta-1 and beta-2 adrenergic receptors, leading to increased heart rate, myocardial contractility, and bronchodilation while reducing peripheral vascular resistance. Though its use has declined with the advent of more selective agents like albuterol (for respiratory indications) and other inotropes or chronotropes (in cardiology), it remains a niche therapeutic option in specific clinical scenarios, particularly within hospital emergency departments, intensive care units, and perioperative settings, where rapid onset and short duration of action are advantageous.

The global Isoproterenol Hydrochloride market size was estimated at USD 18.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 2.80% during the forecast period.
