Abstracts

Isotactic polypropylene is a specific stereoisomer of polypropylene characterized by its highly regular molecular structure, where all methyl groups are oriented uniformly on the same side of the polymer backbone. This structural regularity imparts superior mechanical properties, including high tensile strength, stiffness, and chemical resistance, compared to atactic or syndiotactic forms. It is produced through Ziegler-Natta or metallocene catalysts, which enable precise control over tacticity, resulting in a semicrystalline thermoplastic widely used in applications requiring durability, such as automotive components, consumer goods, packaging films, fibers, and medical devices. Its versatility, recyclability, and balance of performance and cost efficiency make it a foundational material in the plastics industry.

The global Isotactic Polypropylene market size was estimated at USD 88045.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
