## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Isotropic Ferrite Magnet competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Isotropic ferrite magnets are ceramic permanent magnets made from a uniformly oriented mixture of iron oxide ( $\text{Fe}_2\text{O}_3$ ) and either strontium or barium carbonate, sintered into a polycrystalline structure whose magnetic domains are randomly distributed, giving equal magnetic properties in all directions and allowing flexible multi-pole magnetization at lower cost compared with anisotropic grades. Their supply chain begins upstream with mined iron oxide, barium/strontium salts, and ceramic additives ( $\text{CaCO}_3$ ,  $\text{SiO}_2$ ), which are milled, mixed, calcined, pressed, and sintered by midstream ferrite producers using wet pressing or injection molding; downstream, isotropic ferrite magnets are cut, surface-finished, magnetized, and assembled into motors, sensors, speakers, appliances, toys, and automotive components, where their low cost, corrosion resistance, and stable performance make them the dominant volume magnet in consumer and small motor applications. In 2024, global isotropic ferrite magnet production reached 1.05 million tons annually against an installed 1.5 million-ton capacity, with unit prices of USD 2,200-2,850 per ton and manufacturers achieving an average 21% gross margin.

The global Isotropic Ferrite Magnet market size was estimated at USD 2450.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
