Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Isotropic Graphite competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Isotropic graphite production reached approximately 122794 Tonnes, with an average global market price of around US\$ 10316 per tonne. Isotropic graphite is a kind of graphite material that crystals are disorderly arranged while having an isotropic structure. Isotropic graphite is a ultra-fine grain graphite used for applications where the mechanical properties of other fine grain graphite are inadequate. Its name is derived from the method of production: During the forming process the material is isostatically pressed i.e. with equal pressure from every side. Therefore the material shows typically an isotropic property behavior. Nowadays Isotropic Graphite is quite popular material that is in great demand in the photovoltaic industry and is indispensable in semiconductors production. Market size and growth potential Driven by the demand in fields such as photovoltaics, semiconductors, and new energy, the compound annual growth rate of the future market size will show a significant increase. Technological upgrading and domestic substitution Breakthrough in high-end: Domestic isostatic graphite has gradually approached international standards in terms of purity (?99.999%) and strength (?50 MPa), but high-end products still rely on imports. Process innovation: Continuous graphitization technology shortens the production cycle to 7 days and reduces energy consumption by 40%; ultrafine structure (particle size ? 5 ?m) and ultra-high temperature (? 3000°C) technologies have become the focus of research. Trend of self-reliance: Driven by geopolitics, domestic enterprises accelerate the coordinated layout of policy and industrial chain for high-end products such as nuclear-grade graphite and silicon carbide graphite. Policy and industrial chain synergy Policy support: China's "14th Five-Year Plan" lists high-end graphite products as key research and

development directions, and the first-time application subsidy for new materials is up to 30 million yuan. Industrial chain integration: Leading enterprises build an "resources - processing - application" integrated model, and market concentration continues to increase. Challenges and risks Raw material fluctuations: Fluctuations in upstream raw materials such as petroleum coke and asphalt coke affect costs. Environmental constraints: The ton carbon emission in the graphitization process reaches 6.8 tons, and enterprises need to layout green electricity + CCUS technologies. Threats from alternative materials: Silicon-based negative electrode materials may impact the traditional graphite market. Future outlook Application scenarios expansion: The demand growth rate of emerging fields such as hydrogen fuel cell bipolar plates and aerospace composite materials is accelerating. Global competition: China's graphite production accounts for more than 70% of the global total, but the high-end market still faces technical barriers from Japan and South Korea.

The global Isotropic Graphite market size was estimated at USD 1279.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 2.50% during the forecast period.
