Abstracts

Itopride hydrochloride is a prokinetic agent used primarily in the treatment of gastrointestinal motility disorders, such as functional dyspepsia, gastroparesis, and gastroesophageal reflux disease. It functions by inhibiting both dopamine D2 receptors and acetylcholinesterase, thereby enhancing gastric emptying and reducing symptoms like bloating, nausea, and abdominal discomfort. The compound is chemically classified as a benzamide derivative and is administered orally, often in tablet form. Itopride hydrochloride is recognized for its dual mechanism of action, which distinguishes it from other prokinetic drugs, and it is commonly prescribed in regions where it has received regulatory approval, particularly across parts of Asia, the Middle East, and Latin America.
