Report Overview

Small animal in vivo imaging technology refers to the application of imaging methods in vivo to conduct qualitative and quantitative studies on biological processes at the tissue, cell and molecular levels. In vivo imaging is one of the technologies for long-term longitudinal studies on animals without damaging them. Imaging technology can provide absolute quantitative and relative quantitative data, which varies according to its position in the sample. Such technologies provide absolute quantitative information, such as CT, MRI and PET; image data signals are related to the position of the sample, such as bioluminescence, fluorescence and multiphoton microscopy in visible light imaging, which belong to the category of relative quantification, but can be quantified through rigorous experimental design.
