Abstracts

Jacketed Laboratory Reactor is a laboratory device that uses the increased thermal resistance of the wall of the container containing the reactants to control the reaction temperature by circulating constant temperature heating or cooling liquid in the jacket. It is usually composed of a glass reactor (the inner wall may be silver-plated), a stainless steel jacket, a stirring device, an inlet and outlet, a thermometer and a pressure gauge. It has the characteristics of small size, high transparency, precise temperature control, good stirring effect, easy cleaning and maintenance, and safe use. It is widely used in chemical synthesis experiments, especially in the field of organic synthesis where precise temperature control is required to improve the purity and yield of the product.

The global Jacketed Laboratory Reactor market size was estimated at USD 117.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
