Abstracts

A jacketed reaction vessel is a device used for chemical reactions. It is characterized by a double-layer structure. The inner layer is used to hold the reactants, and the outer layer forms a jacket for passing heating or cooling media (such as steam, cold water, etc.) to accurately control the reaction temperature. This design is suitable for chemical reactions that require strict temperature control, such as pharmaceuticals and chemicals. Jacketed reaction vessels are usually made of corrosion-resistant materials such as stainless steel, and their capacity ranges from a few liters to tens of thousands of liters.

The global Jacketed Reaction Vessel market size was estimated at USD 1506.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
