Gross Profit Margin: 56%. A Jar Test Apparatus is a laboratory instrument used in water and wastewater treatment plants to simulate coagulation, flocculation, and sedimentation processes on a small scale, helping determine the optimal type and dosage of coagulants or flocculants. It typically consists of a set of beakers (usually 4 or 6), placed on a platform with variable-speed paddles or stirrers, allowing operators to mix water samples with treatment chemicals under controlled conditions. The industry chain of Jar Test Apparatus starts with raw materials like stainless steel, motors, and electronic components, which are manufactured into multi-station jar testers by lab equipment producers, then distributed through scientific suppliers and online platforms, and finally used in water treatment plants, research labs, and environmental monitoring for coagulation and flocculation testing.

The global Jar Test Apparatus market size was estimated at USD 1314.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.60% during the forecast period.
