### Report Overview

A jejunostomy tube (J-tube) is a medical device inserted directly into the jejunum, the middle section of the small intestine, to provide enteral nutrition for patients who cannot consume food orally. It is commonly used for individuals with gastrointestinal obstructions, severe dysphagia, or conditions like gastroparesis, cancer, or neurological impairments that impair normal digestion. The tube allows for the delivery of liquid nutrients, medications, and hydration, either continuously or intermittently, ensuring patients receive adequate nutritional support. J-tubes are differentiated from gastrostomy tubes (G-tubes) by their placement beyond the stomach, making them suitable for patients at risk of aspiration or those with impaired gastric emptying. They can be surgically, endoscopically, or radiologically placed, with variations like percutaneous endoscopic jejunostomy (PEJ) or direct surgical jejunostomy (DJ) depending on clinical needs.

The global market for jejunostomy tubes is driven by an aging population, rising prevalence of chronic diseases, and increasing demand for long-term enteral nutrition solutions. North America and Europe dominate due to advanced healthcare infrastructure, while Asia-Pacific shows high growth potential due to improving medical access. Key players include Fresenius Kabi, Avanos Medical, and Boston Scientific, with innovation focusing on minimally invasive placement techniques and reduced complication rates. Regulatory standards, reimbursement policies, and infection control challenges influence adoption, while homecare settings are expanding as a key end-user segment.
