## Abstracts

Jervine is a naturally occurring steroidal alkaloid that has drawn significant attention in the scientific and medical communities due to its unique properties and potential applications. It is primarily found in plants of the genus *Veratrum*, such as *Veratrum californicum*. Structurally, jervine features a complex steroidal backbone with specific functional groups that confer it with distinct biological activities. One of the most notable characteristics of jervine is its ability to act as an inhibitor of the Hedgehog signaling pathway, a crucial signaling cascade involved in embryonic development, tissue homeostasis, and cancer progression. In the context of embryonic development, interference with the Hedgehog pathway by jervine can lead to developmental abnormalities, as evidenced by its association with birth defects in animals exposed to plants containing this alkaloid. In the realm of cancer research, jervine's potential as an anti-cancer agent has been explored, as targeting the Hedgehog pathway may offer a way to disrupt the growth and survival of cancer cells that rely on this pathway for their proliferation. Additionally, jervine has been studied for its effects on cell differentiation and other cellular processes, making it a valuable compound for understanding fundamental biological mechanisms. However, due to its potential toxicity and the complexity of its biological actions, careful research and regulation are required when working with jervine.

The global Jervine market size was estimated at USD 327.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
