Report Overview

Jewel bearings are a special type of bearings that are usually made up of jewels such as sapphire, ruby, and zirconia. These have metal spindles, which provide the rotational motion. Jewel bearings can easily handle loads up to 500g; hence, these are used in small load applications. These bearings largely help in restraining the direction of motion and reduce the mechanical friction between the moving components. Precious jewels, apart from being visually pleasing, have significant mechanical strength and sturdiness. These jewels are highly resistant to mechanical wear and erosion. Furthermore, these jewels can be machined to extremely close tolerances due to high hardness. This makes them an ideal choice for micro mechanisms and complex linkages. Jewel bearings are largely used in compact mechanical systems such as clock/watches, calibration machines, and ultrasensitive measuring instruments & systems.

The global Jewel Bearing market size was estimated at USD 2813 million in 2023 and is projected to reach USD 4833.82 million by 2032, exhibiting a CAGR of 6.20% during the forecast period.
