Abstracts

Artificial diamonds, also known as lab-grown or synthetic diamonds, are gem-quality diamonds created in controlled laboratory environments using technological processes that replicate the natural conditions under which diamonds form, primarily through High Pressure High Temperature (HPHT) or Chemical Vapor Deposition (CVD) methods; these stones possess identical physical, chemical, and optical properties to mined diamonds but are distinguished by their origin, ethical production free from mining-related environmental and social concerns, and typically lower price points due to more efficient and scalable manufacturing. The market for jewelry featuring artificial diamonds has expanded rapidly, driven by growing consumer awareness of sustainability, increased affordability making diamond jewelry accessible to a broader demographic, and advancements in production technology enhancing quality and size availability, positioning these gems as a disruptive force challenging the traditional natural diamond industry while appealing particularly to younger, ethically-conscious consumers seeking luxury without compromise.

The global Jewelry Artificial Diamond market size was estimated at USD 3235.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
