## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on K-type PFPE Coolant competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Global production of K-type PFPE coolant reached 2,275 tons in 2024, with an average selling price of \$168/kg. K-type PFPE coolant is a narrow-fraction product derived from K-type PFPE after electronic-grade post-treatment. It is currently the highest-performing fluorinated coolant in single-phase/two-phase immersion cooling. Using hexafluoropropylene oxide (HFPO) as the sole monomer, it undergoes anionic polymerization followed by fluorination to produce a multi-branched perfluoropolyether (molecular weight 500-3000, degree of polymerization 2-7). Containing only the elements C, F, and O, it is a colorless, odorless, transparent oil with no flash point, is non-flammable, and is virtually non-volatile. Multi-stage molecular distillation produces a narrow fraction between 50 and 260°C, which is then filtered to a 0.1 µm ultra-clean surface to produce "electronics-grade coolant." Hexafluoropropylene oxide (HFPO) accounts for 55-60% of the cost, with 70% of global production capacity concentrated in Chemours, Daikin, and Solvay.

The global K-type PFPE Coolant market size was estimated at USD 382.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.90% during the forecast period.
