Abstracts

Karyotype analysis is a cytogenetic diagnostic service that involves the microscopic examination of an individual's chromosomes to assess their number, size, shape, and structural integrity, typically using G-banding techniques on cultured cells obtained from blood, bone marrow, amniotic fluid, or other tissue samples. This technique enables the identification of chromosomal abnormalities?such as aneuploidies (e.g., trisomy 21 in Down syndrome), translocations, deletions, duplications, and inversions?which are critical for diagnosing genetic disorders, guiding reproductive decisions, informing cancer prognostication (particularly in hematologic malignancies), and supporting research in genetics and developmental biology.

The global Karyotype Analysis Service market size was estimated at USD 350.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
