Report Overview:

Keratin is one of the fibrous structural protein family. The main protein constitutes the outer layer of hair, horns, claws and human skin. Keratin can protect epithelial tissue cells from damage or stress. Keratin monomers form bundles to form intermediate fibrin.

There are several different types of keratin, which differ in their amino acid composition and arrangement. For example, hair and nails contain hard keratins, which are more compact and resistant to wear and tear, while skin contains soft keratins that are more pliable and flexible. More than 20 kinds of keratin peptide chains have been found, and hair keratin and epidermal keratin are composed of different keratin peptide chains. Keratin contains high cysteine, and the cross-linking of cysteine is the main cross-linking structure of keratin, and the physical and chemical properties of keratin are mainly related to this cross-linking structure.

The Global Keratin Market Size was estimated at USD 167.28 million in 2023 and is projected to reach USD 242.71 million by 2029, exhibiting a CAGR of 6.40% during the forecast period.
