Report Overview:

KeyHole or Arthroscopic surgery is a type of orthopedic surgery that utilizes an instrument called an arthroscope which essentially is a lens connected via fibre-optic cable to a monitor. It is so called keyhole or minimally invasive as it can be performed requiring only small incisions, usually around around ? of a centimeter. These incisions are called portals.

Keyhole Orthopaedic Surgery Instruments include Powered Shaver Systems, Visualization Systems, Fluid Management Systems, Ablation Systems, Arthroscopes, Arthroscope Implants, Accessories and Disposables. The surgeon can view the inside of the joint directly through the arthroscope, or an image may be displayed on a monitor. This image gives the surgeon a clear view of the tissue inside the joint. The surgeon can then use other tiny instruments specially designed for arthroscopic surgery to perform necessary procedures. Arthroscopic surgery can be used as a diagnostic tool, or for therapeutic procedures ranging from easing the pain of arthritis patients to mending torn ligaments. This range from shoulder stabilization, rotator cuff repair, capsular release for frozen shoulder, acromioclavicular joint reconstruction (dislocation of the outermost part of the collar bone which many cyclist suffer from after a fall), tennis elbow release, knee meniscus debridement (clean up)/ repair, ligamentous (anterior and posterior cruciate) reconstruction, hip labral debridement repair.

The Global Keyhole Orthopaedic Surgery Instruments Market Size was estimated at USD 6669.23 million in 2023 and is projected to reach USD 9786.31 million by 2029, exhibiting a CAGR of 6.60% during the forecast period.
