Report Overview

A kidney stone extraction balloon is a surgical device used for the enlargement of ureteral structures prior to kidney stone removal process which is done by ureteroscopy. Kidney stone extraction balloon is introduced in a shrunk position and upon reaching intended location, it is inflated, and later removed in a deflated manner. Kidney stone extraction balloon is made of a balloon-like structure at the tip and is exercised for enlarging a slender track in the ureter or other connected parts. The inflation of kidney extraction balloon is done with aseptic water. Air is usually avoided as it may cause the balloon to drift, and presence of dissolved salt in water may cause deflation process to become complicated. The kidney stone balloon catheters are present on the bases of size of the balloon.
