Report Overview

Industrially there are two ways to detect the presence of bacterial endotoxins, the major one being using a kinetic chromogenic spectrophotometer and the other being the chromogenic method. The kinetic chromogenic method is based on the measurement of color at different intervals of time. The advantages of this method is varied: it could be totally automated, it allows for the measurement of many samples in a short period of time and the results are processed easily. The kinetic chromogenic spectrophotometer method, as the name indicates, measures the appearance of color once the enzymatic reaction is over.
