Abstracts

A kinetic energy storage flywheel is a mechanical device that stores energy in the form of rotational kinetic energy by spinning a rotor at very high speeds. The flywheel system typically consists of a rotor, bearings, and a motor-generator. Energy is stored when the motor accelerates the rotor to high speeds, and it is released when the rotor slows down, driving the generator to produce electricity. Flywheels offer high power density, rapid response times, and long life cycles with minimal maintenance. They are used in applications such as grid energy storage, uninterruptible power supplies (UPS), and regenerative braking systems in vehicles, providing efficient energy storage and release with low environmental impact.

The global Kinetic Energy Storage Flywheel market size was estimated at USD 236.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.50% during the forecast period.
