Report Overview

A kinetic energy storage flywheel is a mechanical device that stores energy in the form of rotational kinetic energy by spinning a rotor at very high speeds. The flywheel system typically consists of a rotor, bearings, and a motor-generator. Energy is stored when the motor accelerates the rotor to high speeds, and it is released when the rotor slows down, driving the generator to produce electricity. Flywheels offer high power density, rapid response times, and long life cycles with minimal maintenance. They are used in applications such as grid energy storage, uninterruptible power supplies (UPS), and regenerative braking systems in vehicles, providing efficient energy storage and release with low environmental impact.

The global Kinetic Energy Storage Flywheel market size was estimated at USD 215 million in 2023 and is projected to reach USD 486.59 million by 2032, exhibiting a CAGR of 9.50% during the forecast period.

North America Kinetic Energy Storage Flywheel market size was estimated at USD 65.52 million in 2023, at a CAGR of 8.14% during the forecast period of 2024 through 2032.
