## Abstracts

Kiss cutting gaskets refers to a precise manufacturing process used to create gaskets. In this process, a cutting tool, such as a die or a blade, is used to cut through the material of the gasket just enough to separate it from the surrounding substrate or carrier material, without completely severing or damaging the gasket itself. The term "kiss" implies a gentle and controlled cut that leaves the gasket intact and in the desired shape and size. This method is often preferred when dealing with delicate or thin materials, as it allows for high precision and minimal waste. Kiss cutting can be used with a variety of gasket materials, including rubber, foam, silicone, and various polymers. It is widely applied in industries such as automotive, electronics, and manufacturing, where accurate and reliable gaskets are crucial for ensuring proper sealing, insulation, and vibration dampening in different mechanical and electronic assemblies.

The global Kiss Cutting Gaskets market size was estimated at USD 267.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
