Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Knitted Polyester Geogrids competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Knitted Polyester Geogrids production reached approximately 139.71 million square meter, with an average global market price of around US\$ 2.8 per square meter. A knitted polyester geogrid is a two-dimensional grid-like geosynthetic material manufactured from high-strength polyester (PET) industrial filaments. It is produced by knitting them into a mesh substrate using warp-knitting machines, followed by oriented stretching and coating with a polymeric layer (e.g., PVC or modified asphalt). Its core characteristic lies in the high junction strength and integrity provided by the knitting technology, combined with the high tensile strength, low creep, and excellent chemical resistance of polyester. It functions by interlocking with soil particles through friction and mechanical restraint, significantly improving the load-bearing capacity of soil, distributing loads, and limiting lateral displacement, making it widely applicable for soil reinforcement in civil engineering projects.

The global Knitted Polyester Geogrids market size was estimated at USD 391.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.40% during the forecast period.
