Abstracts

Knotless suture anchors represent a significant advancement in orthopedic and sports medicine procedures, particularly in soft tissue-to-bone repair, such as rotator cuff or labral repairs, as they integrate both the anchor and suture into a single, streamlined device that eliminates the need for traditional knot-tying techniques. These implants are typically made from biocompatible materials like PEEK (polyetheretherketone), biocomposite polymers, or metals and are designed to provide secure fixation while reducing surgical time, minimizing soft tissue trauma, and lowering the risk of knot-related complications such as slippage or irritation. Their mechanism often involves a self-locking or tensioning feature that allows surgeons to adjust and secure sutures under optimal tension, enhancing repair integrity and potentially improving patient outcomes through more reliable and efficient fixation.

The global Knotless Suture Anchors market size was estimated at USD 580.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
