Abstracts

Photoresist is a photosensitive mixed liquid mainly used to transfer images from a mask onto a silicon chip. KrF resist, also known as KrF photoresist, is a widely used photoresist material in semiconductor manufacturing. KrF resist has photosensitive properties. Under radiation such as ultraviolet light, electron beam, ion beam, etc., its solubility will change, and then the soluble part will be dissolved by the solvent to achieve the transfer of the pattern from the mask to the substrate to be processed. The undissolved portion serves as a protective layer to protect the underlying material from etching in subsequent etching steps. KrF resist is highly sensitive to ultraviolet light at 248 nanometers, allowing for accurate replication of patterns on lithography plates during the lithography process. With the development of semiconductor processing technology below 350nm, g-line and i-line photoresists can no longer meet such needs, and KrF photoresists suitable for 248nm wavelength light sources have emerged. KrF photoresist is mainly used in 3D NAND stacking architecture. With the increase of stacking layers, the consumption of KrF photoresist will be greatly increased. According to the SEMI report, the semiconductor materials market will grow by 8.6% in 2022, reaching a market size of 69.8 billion US dollars new highs. Since semiconductor materials belong to high-tech barrier industries, most of the high-end products of semiconductor materials are currently concentrated in the United States, Japan, Germany and other countries and regions. From the perspective of demand, China Taiwan, China mainland, South Korea, Japan, and the United States are the largest semiconductor material markets in the world, accounting for more than 80% of the global market.

The global KrF Resist market size was estimated at USD 826.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.70% during the forecast period.
