Abstracts

Krypton-85 is a radioactive isotope of the noble gas krypton, with a half-life of approximately 10.76 years. It is produced through nuclear fission in nuclear reactors and as a byproduct of nuclear fuel reprocessing. Krypton-85 emits beta radiation and is primarily used in a variety of industrial, scientific, and commercial applications. One of the key uses of Krypton-85 is in leak detection for sealed containers, as its beta radiation allows for precise identification of even the smallest leaks. It is also widely used in industrial thickness gauging, where its radiation properties help measure the thickness of materials such as plastic films, rubber, and metal coatings. Additionally, Krypton-85 plays a role in lighting applications, particularly in gas discharge lamps, where it enhances efficiency and performance. Beyond these practical applications, Krypton-85 has been used in atmospheric studies to track air movements and in nuclear security for detecting unauthorized nuclear activities. The isotope's presence in the environment is carefully monitored due to its potential contribution to background radiation levels. The demand for Krypton-85 has been relatively stable, driven by its applications in leak detection, industrial gauging, and lighting. As manufacturing processes continue to require precise quality control methods, the use of Krypton-85 in thickness gauging and defect detection remains important. In the security sector, Krypton-85 is instrumental in detecting clandestine nuclear activities. Governments and international regulatory bodies monitor the isotope's presence as part of nuclear non-proliferation efforts. As geopolitical concerns over nuclear security persist, the demand for Krypton-85 in monitoring applications is expected to continue. However, the reduction in nuclear fuel reprocessing activities in some regions has impacted the availability of Krypton-85. Countries with strict nuclear policies may see a decline in Krypton-85 production, affecting its supply chain and market dynamics. Innovations in radiation detection technology have improved the efficiency and precision of Krypton-85 applications. Advancements in sensor technology allow for better monitoring of the

isotope in industrial and environmental settings. Additionally, researchers are exploring alternative methods for industrial gauging and leak detection that could reduce reliance on radioactive materials. In the lighting industry, developments in LED and other energy-efficient technologies have reduced the demand for Krypton-85 in gas discharge lamps. While these alternative technologies offer enhanced efficiency and longevity, Krypton-85-based lamps remain in use for specialized applications requiring specific spectral properties. Global key players of Krypton-85 include ROSATOM Group and Eckert & Ziegler, etc. The top two players hold a share over 60%. Europe is the largest market, has a share about 32%. In terms of application, Leak Detection Test has a share about 68 percent.

The global Krypton-85 market size was estimated at USD 155.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.70% during the forecast period.
