Report Overview

Lab automation is the use of instrumentation to perform laboratory processes, requiring minimal human input. Automation can be used anywhere from a single step of an experimental process, all the way through to the entire workflow. The product range available is now vast, making use of robotics, computers, and software. Automating laboratory tasks improves the overall efficiency of experimental processes by speeding up tasks, cutting waste, using lower quantities of reagents, and allowing for higher throughput of experiments. Combined, this higher efficiency leads to lower running costs of the laboratory. Using automated systems in the lab saves researchers from performing time-consuming and repetitive tasks, freeing them up to carry out more specialized processes. Automation also aims to increase data reliability and accuracy, as error and variability can occur at all stages of the experimental process. Furthermore, automated technology can improve laboratory safety by using automated systems to handle, and correctly store, harmful substances. Consequently, laboratory personnel is more protected from the exposure of these harmful reagents and processes.

Proteomics generally refers to the large-scale experimental analysis of proteins and proteomes, advanced laboratory automation equipment has promoted the development of proteomics.
