## Abstracts

Labeled nucleotides are modified forms of nucleotides that have a specific chemical or radioactive label attached to them. These labels allow researchers to track, visualize, and detect specific nucleic acids in various molecular biology applications. Labeled nucleotides are commonly used in techniques such as DNA sequencing, PCR (polymerase chain reaction), in situ hybridization, DNA labeling, and nucleic acid microarray analysis. Labeled nucleotides can be labeled with different types of labels, including fluorescent dyes, radioactive isotopes, or biotin. Fluorescently labeled nucleotides are widely used for fluorescence in situ hybridization (FISH), where they are incorporated into DNA or RNA probes to detect specific sequences in cells or tissues. These probes can be visualized under fluorescence microscopy, allowing for the visualization and localization of specific genetic sequences. Radioactively labeled nucleotides, such as [32P]-labeled or [35S]-labeled nucleotides, are commonly used in techniques like DNA sequencing or autoradiography. Radioactive labels emit radiation that can be detected using specialized equipment or X-ray films, enabling the determination of nucleotide sequences or the detection of radiolabeled targets in biological samples. Biotin-labeled nucleotides are frequently used in techniques like DNA labeling or nucleic acid microarray analysis. Biotin is a small molecule that can bind specifically to avidin or streptavidin, allowing for the indirect visualization or detection of the labeled nucleotide through the use of fluorescently or enzymatically labeled avidin/streptavidin conjugates. The use of labeled nucleotides in molecular biology provides researchers with powerful tools for studying nucleic acids, gene expression, genetic variation, and various other molecular processes. The choice of label depends on the specific application, desired sensitivity, and detection method. Labeled nucleotides enable visualization, quantification, and analysis of nucleic acids, leading to a deeper understanding of genetic information and its role in biological processes.

The global Labeled Nucleotides market size was estimated at USD 2303.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.40% during the forecast period.
