Report Overview:

A lab recirculating chiller can achieve temperature ranges of $-25\text{ }^{\circ}\text{C}$ to $130\text{ }^{\circ}\text{C}$ (thus, some can double as heaters as well). Digital PID temperature controllers ensure that the recirculating cooler/recirculating chiller reaches the desired temperature precisely and quickly. The customer should seek recirculating chillers with a front filling port and no side vents, making them safe to place near other laboratory equipment, without the risk of water damage.

A laboratory circulator will typically feature a liquid reservoir, a heating and/or cooling system, and a temperature control mechanism. Some lab circulators are designed to work in conjunction with a separate liquid bath or water jacket, while others combine both a circulator and an open bath basin/water jacket in one. Temperature ranges can be as wide as $-95\text{ }^{\circ}\text{C}$ to $200\text{ }^{\circ}\text{C}$, with pump flows of up to 26 L per minute. As a general rule, high-end lab circulators have a wider temperature range than economy models. Most laboratory circulators utilize digital temperature control, but a few employ analog technology for cost savings and customization.

The Global Laboratory Chillers and Circulators Market Size was estimated at USD 331.05 million in 2023 and is projected to reach USD 414.07 million by 2029, exhibiting a CAGR of 3.80% during the forecast period.
