### Report Overview

The laboratory purity analyzer is used to test the purity of precious metals, liquids and gases. Precious metals include gold, silver, copper, platinum, zinc, nickel, cadmium, etc., and the corresponding purity analyzer is mostly based on the principle that the energy characteristics of secondary X-rays released by different atoms after X-ray collision are different. Liquid purity analyzers are manufactured based on the solute's optical rotation or refractive index relative to the concentration of the solution. Gas purity analyzers are manufactured based on the difference of thermal conductivity of the gas, electromotive force generated by the difference of the concentration of the gas in the dielectric at high temperature, and the characteristic of selective absorption of the infrared radiation at different wavelengths.
