Abstracts

A lacrimal duct stent system is a medical device used to treat nasolacrimal duct obstruction, a condition where the tear drainage system from the eye to the nose becomes blocked, leading to excessive tearing, discharge, or recurrent infections. These systems typically consist of a flexible, tubular stent—often made of silicone or other biocompatible materials—that is inserted into the lacrimal duct to maintain patency, facilitate drainage, and support healing after procedures such as dacryocystorhinostomy (DCR) or balloon dacryoplasty. The stent may be designed for temporary placement, often removed after several months once healing is complete, or in some cases, left in place longer-term depending on the clinical scenario and material properties. These devices are integral to oculoplastic and ophthalmologic surgical practices, offering a minimally invasive alternative to more complex external surgeries and helping restore normal lacrimal function with reduced patient recovery time and risk of scarring.

The global Lacrimal Duct Stent System market size was estimated at USD 420.3 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.15% during the forecast period.
