Abstracts

Breathable brick core is an important component of refined refractory materials. In most external refining equipment, breathable bricks are used to blow inert gas (such as argon) into the furnace to enhance the stirring of the molten pool and achieve uniform temperature and composition. In processes such as LF, VD, CAS-OB, etc., without the normal operation of bottom blowing breathable brick cores, the above processes cannot be carried out. Therefore, the role of breathable brick cores in refining outside the furnace is very important. Ladle breathable brick is a refractory material commonly used at the bottom of steel ladles, especially in electric furnace steelmaking or converter steelmaking processes. Its main function is to provide breathability, help the flow of gas in the ladle, and promote the stirring and homogenization of the molten steel. Breathable bricks are usually made of refractory materials with high temperature strength and chemical stability, commonly including bauxite, magnesia, or chrome materials. Breathable bricks can not only withstand high temperatures, but also provide good gas permeability, which helps to transfer oxygen from gas to molten steel or remove impurities from molten steel during smelting.

The global Ladle Breathable Brick market size was estimated at USD 347.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
